**YAESU MUSEN CO., LTD.**

# CAT (Computer Aided Transceiver) Operation

## Overview

The CAT (Computer Aided Transceiver) System in the **FTDX10** transceiver provides control of frequency, VFO, memory, and other settings such as dual-channel memories and diversity reception using an external personal computer. This allows multiple control operations to be fully automated with single mouse clicks, or keystroke operations on the computer keyboard.

### Using the USB Cable

The **FTDX10** transceiver has a built-in USB to Dual UART Bridge, allowing direct connection from the rear-panel USB jack to the USB jack of a computer without the need for an interface device, simply use a USB cable to connect to the USB jack on the computer.

To connect to a PC using a USB cable, a Virtual COM port driver must be installed on the PC. Visit the Yaesu website <http://www.yaesu.com/> to download the Virtual COM port driver and Installation Manual.

YAESU MUSEN does not produce CAT System operating software due to the wide variety of personal computers and operating systems in use today. However, the information provided in this chapter explains the serial data structure and opcodes used by the CAT system. This information, along with the short programming examples, is intended to help you start writing programs on your own. As you become more familiar with CAT operation, you can customize programs for your operating needs and utilize the full operating potential of this system.

### How to Confirm the Installation, and the COM Port Number

After the FTDX10 and computer are connected, confirm that the virtual COM driver has been installed successfully:

1. Press and hold the ON/OFF switch to turn the transceiver ON.
2. Connect the transceiver and PC with a commercially available USB cable (A-B).
3. Open the "Device Manager" screen in Windows.
4. On the Device Manager screen, double-click "Port (COM & LPT)".

"Silicon Labs Dual CP210x USB to UART Bridge : Enhanced COM Port (COM\*\*)"

"Silicon Labs Dual CP210x USB to UART Bridge : Standard COM Port (COM\*\*)"

\*(The number in the "(COM\*\*)" portion may vary from computer to computer.)

The FTDX10 contains two virtual COM ports, an Enhanced COM Port and a Standard COM Port.

These ports offer the following functions:

- **Enhanced COM Port:** CAT Communications (Frequency and Communication Mode Settings)
- **Standard COM Port:** TX Controls (PTT control, CW Keying, Digital Mode Operation)

The above example indicates that COM5 can be used for CAT communications and firmware updating, while COM6 can be used for TX control (PTT, CW Keying, Digital Mode Operation).

# CAT (Computer Aided Transceiver) Operation

---

When performing software port configuration, select the COM port numbers that were confirmed using the procedure above, use the two confirmed COM port numbers for each software function. The frequency and communication mode and PTT control can be set from the software, and CW keying, digital communication, etc. can be performed simultaneously.

When performing software port configuration, select the COM port numbers that were confirmed using the procedure above.

- 
- If a “!” or “X” is displayed for the port on the Device Manager, uninstall and reinstall the virtual COM driver.
  - If a transceiver with a different serial number is connected and turned on, different COM port numbers will be assigned to it, making it possible to perform individual COM port configurations for separate transceivers.
  - When using the USB cable for TX control, the transceiver may switch to the transmit mode when the computer is started.
  - Always close the application on the computer before disconnecting the USB cable.
-

# CAT (Computer Aided Transceiver) Operation

---

## Control Command

---

A computer control command is composed of an alphabetical command, various parameters, and the terminator that signals the end of the control command.

**Example:** Set the VFO-A frequency to 14.250000 MHz.

**FA**            **014250000** ;  
↑                ↑                ↑  
Command    Parameter   Terminator

There are three commands for the **FTDX10** as shown below:

**Set** command: Set a particular condition            (to the **FTDX10**)  
**Read** command: Reads an answer                    (from the **FTDX10**)  
**Answer** command: Transmits a condition            (from the **FTDX10**)

For example, note the following case of the FA command (Set the VFO-A frequency):

- ❑ To set the VFO-A frequency to 14.250000 MHz, the following command is sent from the computer to the transceiver:  
    **"FA014250000;"** (Set command)
- ❑ To read the VFO-A frequency, the following command is sent from the computer to the transceiver:  
    **"FA;"** (Read command)
- ❑ When the Read command above has been sent, the following command is returned to the computer:  
    **"FA014250000;"** (Answer command)

## Alphabetical Commands

A command consists of 2 alphabetical characters.

You may use either lower or upper case characters. The commands available for this transceiver are listed in the "PC Control Command Tables" on the following pages.

## Parameters

Parameters are used to specify information necessary to implement the desired command.

The parameters to be used for each command are predetermined. The number of digits assigned to each parameter is also predetermined. Refer to the "Control Command List" and the "Control Command Tables" to configure the appropriate parameters.

When configuring parameters, be careful not to make the following mistakes.

**For example,**

when the correct parameter is **"IS00+1000"** (IF SHIFT):

**IS001000;**  
    Not enough parameters specified (No direction (+) given for the IF shift)

**IS00+100;**  
    Not enough digits (Only three frequency digits given)

**IS00\_+\_1000;**  
    Unnecessary characters between parameters

**IS00+10000;**  
    Too many digits (Five frequency digits given)

**Note:** If a particular parameter is not applicable to the **FTDX10**, the parameter digits should be filled using any character except the ASCII control codes (00 to 1Fh) and the terminator (;).

## Terminator

To signal the end of a command, it is necessary to use a semicolon (;). The digit where this special character must appear differs depending on the command used.

# CAT (Computer Aided Transceiver) Operation

PS		POWER SWITCH									
Set	1	2	3	4	5	6	7	8	9	10	P1 0: POWER "OFF" 1: POWER "ON"  This command requires dummy data be initially sent. Then after one second and before two seconds the command is sent. (For example, Send "PS1;" command, wait 1 second, and then Send "PS1;" command again within 2 seconds.)
	P	S	P1	;							
Read	1	2	3	4	5	6	7	8	9	10	
	P	S	;								
Answer	1	2	3	4	5	6	7	8	9	10	 When using an RS-232C cable, the PS command (POWER SWITCH) is not available, so the transceiver cannot be turned ON with the CAT command.
	P	S	P1	;
