**FTDX1200 SERIES**

**CAT OPERATION**

**REFERENCE BOOK**

**YAESU MUSEN CO., LTD.**

# CAT (COMPUTER AIDED TRANSCEIVER) OPERATION

## OVERVIEW

The CAT (Computer Aided Transceiver) System in the **FTDx1200** transceiver provides control of frequency, VFO, memory, and other settings such as dual-channel memories and diversity reception using an external personal computer. This allows multiple control operations to be fully automated with single mouse clicks, or key-stroke operations on the computer keyboard.

### Using the RS-232C Cable (Refer to figure 1)

The **FTDx1200** series has a built-in level converter, allowing direct connection from the rear-panel CAT jack to the serial port of your computer without the need of any external boxes.

You will need a serial cable for connection to the RS-232C (serial or COM port) connector on your computer. Purchase a standard serial cable (not the so-called “null modem” type), ensuring it has the correct gender and number of pins (some serial COM port connectors use a 9-pin rather than 25-pin configuration). If your computer uses a custom connector, you may have to construct the cable. In this case, refer to the technical documentation supplied with your computer for correct data connection.

### Using the USB Cable with SCU-17 (Refer to figure 2)

Install the virtual COM port driver on the personal computer before using the **SCU-17** USB interface unit. Please see the USB Driver (Virtual COM Port Driver) on the Yaesu Website for details refer to (<http://www.yaesu.com/>) in the **FTDx1200** product files section.

**Note:** Do not connect the USB cable and **SCU-17** to your personal computer until after the “virtual COM port driver” installation is completed, because an incorrect driver may be installed.

The **SCU-17** interface unit may be used for CAT control of the transceiver with a computer via a USB connection. You will need a USB cable to connect to the USB jack on your computer.

YAESU MUSEN does not produce CAT System operating software due to the wide variety of personal computers and operating systems in use today. However, the information provided in this chapter explains the serial data structure and opcodes used by the CAT system. This information, along with the short programming examples, is intended to help you start writing programs on your own. As you become more familiar with CAT operation, you can customize programs for your operating needs and utilize the full operating potential of this system.

## CONNECTION

PIN No.	PIN NAME	I/O	FUNCTION
①	N/A	—	—
②	SERIAL OUT	Output	Outputs the Serial Data from the transceiver to the computer.
③	SERIAL IN	Input	Inputs the Serial Data from the computer to the transceiver.
④	N/A	---	—
⑤	GND	---	Signal Ground
⑥	N/A	---	---
⑦	RTS	Input	When the computer is not ready to receive data, this port goes to “L” to inhibit the transmit data from the transceiver.
⑧	CTS	Output	When the transceiver is not ready to receive data, this port goes to “L” to inhibit the transmit data from the computer.
⑨	N/A	—	—

FIGURE 2

# CAT (COMPUTER AIDED TRANSCEIVER) OPERATION

## CONTROL COMMAND

A computer control command is composed of an alphabetical command, various parameters, and the terminator that signals the end of the control command.

**Example:** Set the VFO-A frequency to 14.250000 MHz.

<b>FA</b>	<b>14250000</b>	<b>;</b>
↑	↑	↑
Command	Parameter	Terminator

There are three commands for the **FTDx1200** as shown below:

**Set** command: Set a particular condition  
(to the **FTDx1200**)

**Read** command: Reads an answer  
(from the **FTDx1200**)

**Answer** command: Transmits a condition  
(from the **FTDx1200**)

For example, note the following case of the FA command (Set the VFO-A frequency):

- To set the VFO-A frequency to 14.250000 MHz, the following command is sent from the computer to the transceiver:  
“**FA14250000;**” (Set command)
- To read the VFO-A frequency, the following command is sent from the computer to the transceiver:  
“**FA;**” (Read command)
- When the Read command above has been sent, the following command is returned to the computer:  
“**FA14250000;**” (Answer command)

### Alphabetical Commands

A command consists of 2 alphabetical characters.

You may use either lower or upper case characters. The commands available for this transceiver are listed in the “PC Control Command Tables” on the following pages.

### Parameters

Parameters are used to specify information necessary to implement the desired command.

The parameters to be used for each command are predetermined. The number of digits assigned to each parameter is also predetermined. Refer to the “Control Command List” and the “Control Command Tables” to configure the appropriate parameters.

When configuring parameters, be careful not to make the following mistakes.

**For example,**

when the correct parameter is “**ISO+1000**” (IF SHIFT):

**ISO1000;**

Not enough parameters specified (No direction (+) given for the IF shift)

**ISO+100;**

Not enough digits (Only three frequency digits given)

**ISO+\_1000;**

Unnecessary characters between parameters

**ISO+10000;**

Too many digits (Five frequency digits given)

**Note:** If a particular parameter is not applicable to the **FTDx1200**, the parameter digits should be filled using any character except the ASCII control codes (00 to 1Fh) and the terminator (;).

### Terminator

To signal the end of a command, it is necessary to use a semicolon (;). The digit where this special character must appear differs depending on the command used.
